Time Series Modeling of Neuroscience Data (Chapman & Hall/CRC Interdisciplinary Statistics) By Tohru Ozaki

Recent advances in brain science measurement technology have given researchers access to very large-scale time series data such as EEG/MEG data (20 to 100 dimensional) and fMRI (140,000 dimensional) data. To analyze such massive data, efficient computational and statistical methods are required.

Time Series Modeling of Neuroscience Data shows how to efficiently analyze neuroscience data by the Wiener-Kalman-Akaike approach, in which dynamic models of all kinds, such as linear/nonlinear differential equation models and time series models, are used for whitening the temporally dependent time series in the framework of linear/nonlinear state space models. Using as little mathematics as possible, this book explores some of its basic concepts and their derivatives as useful tools for time series analysis. Unique features include:

- A statistical identification method of highly nonlinear dynamical systems such as the Hodgkin-Huxley model, Lorenz chaos model, Zetterberg Model, and more
- Methods and applications for Dynamic Causality Analysis developed by Wiener, Granger, and Akaike
- A state space modeling method for dynamicization of solutions for the Inverse Problems
- A heteroscedastic state space modeling method for dynamic non-stationary signal decomposition for applications to signal detection problems in EEG data analysis
- An innovation-based method for the characterization of nonlinear and/or non-Gaussian time series
- An innovation-based method for spatial time series modeling for fMRI data analysis

The main point of interest in this book is to show that the same data can be treated using both a dynamical system and time series approach so that the neural and physiological information can be extracted more efficiently. Of course, time series modeling is valid not only in neuroscience data analysis but also in many other sciences and engineering fields where the statistical inference from the observed time series data plays an important role.

Editorial Review

Review

"With more statisticians working in the direction of methodological and theoretical research with applications in the neurosciences, the present book is timely. The author is an expert statistician who has made significant contributions to the area of time series and stochastic processes, in addition to methodological developments ... The book is impressive in terms of the breadth of its coverage of the models and the in-depth discussion on the theoretical properties of both discrete-time and continuous-time that are specific to neuroscience data ... the numerous examples on constructing the state-space representation of the time series models were useful, as properly constructing state-space models can be challenging. Moreover, the numerous discussions on the computational challenges for estimating the parameters of state-space models were illuminating."

?*Journal of the American Statistical Association*, December 2014

"This is a very unusual book on time series, with much that is new, innovative, and usually not found in other books on time series, for example multivariate AR models, multivariate dynamic models, causal analysis and the Doob decomposition, and so on. Among the major pleasures of browsing through the book are the acquaintance with 'Laplace's Demon', seeing Pearsonian and multimodal distributions as stationary distributions for dynamic models, Einstein's inductive use of Boltzmann entropy?to mention just a few of the novelties. But the hard core of the book is about state space modeling and its application to neuroscience data. The pages 331 through 351 are a richly textured but precise and detailed introduction to state space modeling. Here is a lovely summary by Ozaki that I have not seen elsewhere?it deals with time series dynamics ..."

?Jayanta K. Ghosh, *International Statistical Review* (2013), 81

"This book is essential for every quantitative scientist who is interested in developing rigorous statistical models for analyzing brain signals. It is written by an expert statistician who has made significant contributions to the area of time series and stochastic processes. ... His expertise on this subject and interest on the deep issues of statistical modeling of brain signals are clearly reflected in the character of this book. This book builds an important foundation for neurostatistics ... it is truly unique in its treatment of the topic because it has an eye towards modeling brain signals, such as electroencephalograms and functional magnetic resonance images, and thus builds on the specifics that are directly relevant to these particular data. ... At the University of California, Irvine, researchers have used this book recently and found it to be very helpful. Moreover, I intend to use this book as the primary text for a special topic course on neurostatistics in the Department of Statistics."

?Hernando Ombao, *Journal of Time Series Analysis*, 2013

About the Author

Tohru Ozaki is a mathematician and statistician. He received his BSc in mathematics from the University of Tokyo in 1969. He then joined the Institute of Statistical Mathematics (ISM), Tokyo, in 1970 and study and worked with Hirotugu Akaike. He received his DSc from Tokyo Institute of Technology in 1981 under the supervision of Akaike. From 1987 to 2008, he was a professor at ISM and, after Akaike's retirement, served as the director of the prediction and control group. His major research areas include time series analysis,

nonlinear stochastic dynamic modeling, predictive control, signal processing and their applications in neurosciences, control engineering, and financial engineering.

While he was at ISM, Ozaki was engaged in various projects in applied time series analysis in science and engineering: EEG dynamic inverse problems, spatial time series modeling of fMRI data, causality analysis in behavioral science, modeling nonlinear dynamics in ship engineering, predictive control design in fossil power plant control, seasonal adjustment in official statistics, heteroscedastic modeling and risk-sensitive control in financial engineering, nonlinear dynamic modeling in macroeconomics, spectral analysis of seismology data, point process modeling of earthquake occurrence data, river-flow prediction in stochastic hydrology, etc.

Ozaki retired from ISM in 2008. Since then he has been a visiting professor at Tohoku University, Sendai, Japan, and at Queensland University of Technology, Brisbane, Australia. He has been involved in supporting several research projects (in dynamic modeling of neuroscience data, fossil power plant control design, and risk-sensitive control in financial engineering) in universities and industry. He has also led, through his international research network, a time series research group called Akaike Innovation School from his office in Mount Fuji and organizes seminars every summer.

Users Review

From reader reviews:

Heather Roberts:

This book untitled Time Series Modeling of Neuroscience Data (Chapman & Hall/CRC Interdisciplinary Statistics) to be one of several books in which best seller in this year, honestly, that is because when you read this reserve you can get a lot of benefit in it. You will easily to buy this particular book in the book shop or you can order it by using online. The publisher of the book sells the e-book too. It makes you more easily to read this book, because you can read this book in your Mobile phone. So there is no reason to you to past this publication from your list.

Howard Kincaid:

Playing with family in a very park, coming to see the ocean world or hanging out with buddies is thing that usually you will have done when you have spare time, then why you don't try issue that really opposite from that. One activity that make you not sense tired but still relaxing, trilling like on roller coaster you already been ride on and with addition info. Even you love Time Series Modeling of Neuroscience Data (Chapman & Hall/CRC Interdisciplinary Statistics), you may enjoy both. It is good combination right, you still desire to miss it? What kind of hang type is it? Oh can occur its mind hangout folks. What? Still don't get it, oh come on its referred to as reading friends.

Mary Benoit:

Time Series Modeling of Neuroscience Data (Chapman & Hall/CRC Interdisciplinary Statistics) can be one of your basic books that are good idea. Many of us recommend that straight away because this e-book has good vocabulary that can increase your knowledge in vocab, easy to understand, bit entertaining but

delivering the information. The article writer giving his/her effort to place every word into delight arrangement in writing Time Series Modeling of Neuroscience Data (Chapman & Hall/CRC Interdisciplinary Statistics) nevertheless doesn't forget the main place, giving the reader the hottest and also based confirm resource information that maybe you can be one of it. This great information could drawn you into fresh stage of crucial contemplating.

Lois Hutter:

This Time Series Modeling of Neuroscience Data (Chapman & Hall/CRC Interdisciplinary Statistics) is brand-new way for you who has fascination to look for some information as it relief your hunger details. Getting deeper you onto it getting knowledge more you know or you who still having little bit of digest in reading this Time Series Modeling of Neuroscience Data (Chapman & Hall/CRC Interdisciplinary Statistics) can be the light food for you personally because the information inside this specific book is easy to get by simply anyone. These books create itself in the form which is reachable by anyone, that's why I mean in the e-book contact form. People who think that in e-book form make them feel tired even dizzy this book is the answer. So there is no in reading a book especially this one. You can find what you are looking for. It should be here for you actually. So , don't miss this! Just read this e-book type for your better life as well as knowledge.
